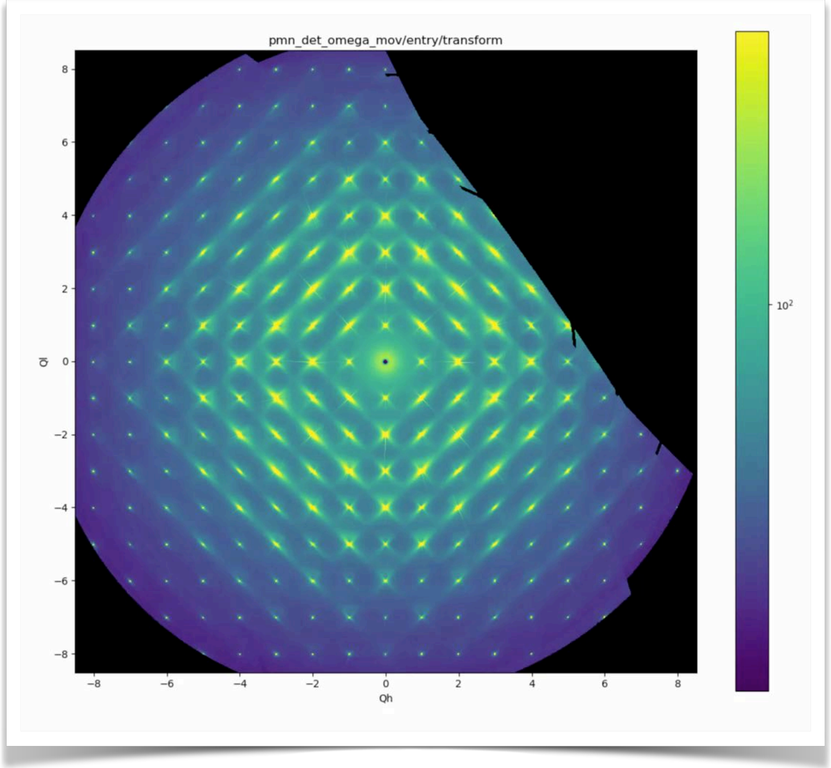
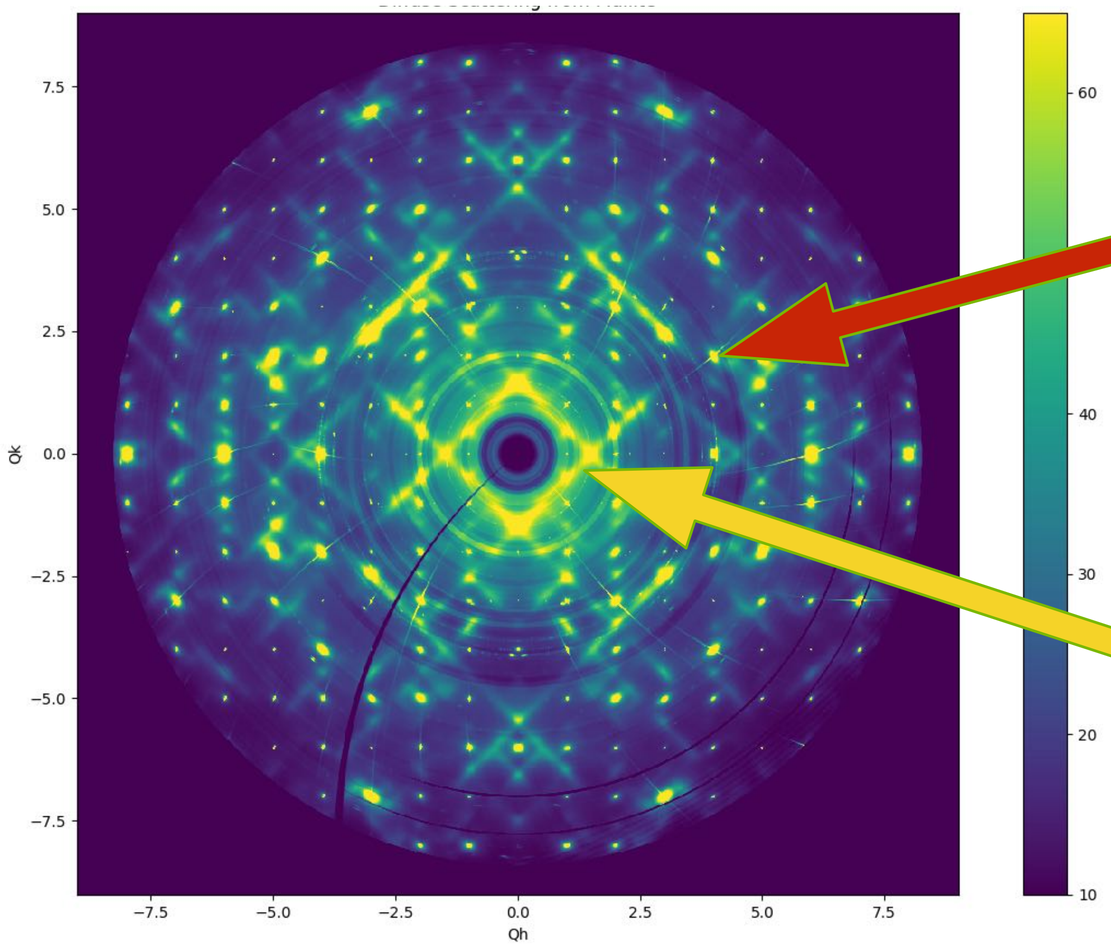
OUTLINE

- What is diffuse scattering?
  - What causes it?
- What is it good for?
  - A random walk through disordered materials
- How do I model it?
  - A few equations
- How do I measure it?
- Case Study 1: Diffuse scattering from vacancies in mullite
- Case Study 2: 3D-ΔPDF in sodium-intercalated V_2O_5
- How do I look at static disorder?
  - Diffuse scattering with elastic discrimination



WHAT IS DIFFUSE SCATTERING?



Bragg Scattering
Average Structure

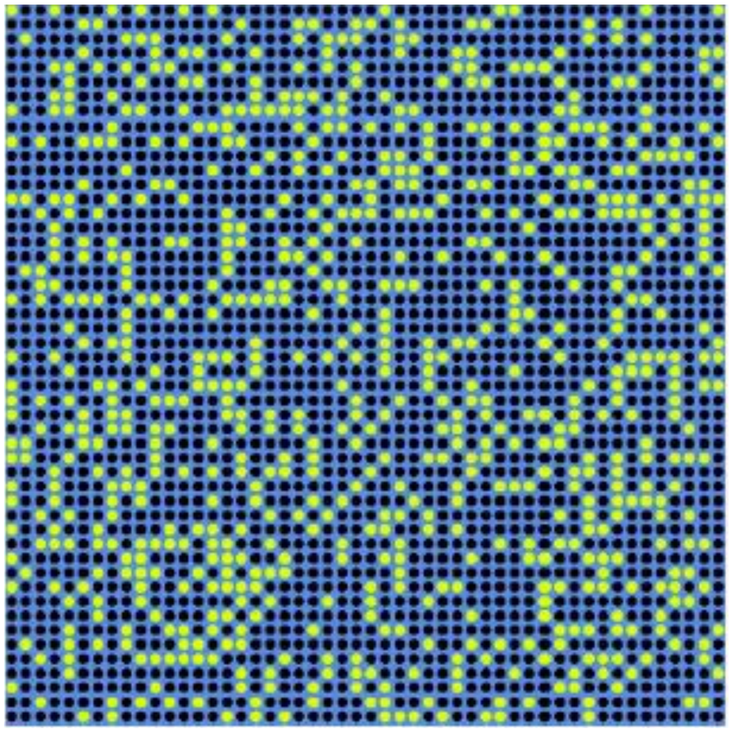
Diffuse Scattering
Deviations from the Average Structure

DIFFUSE SCATTERING

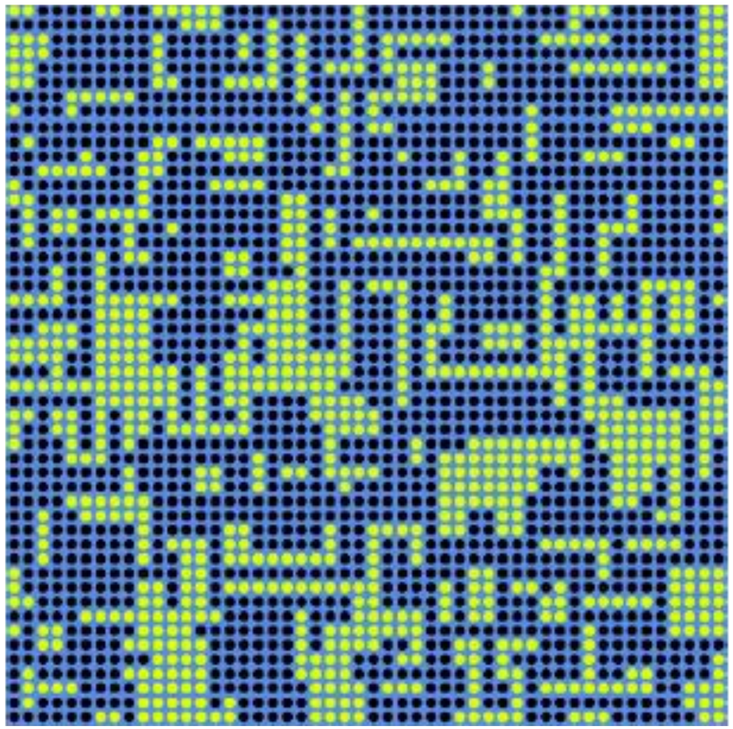
SIMPLE EXAMPLE OF DISORDER

Replace 30% of atoms (blue dots) by vacancies (green dots)

Random Vacancies



Vacancy Clusters

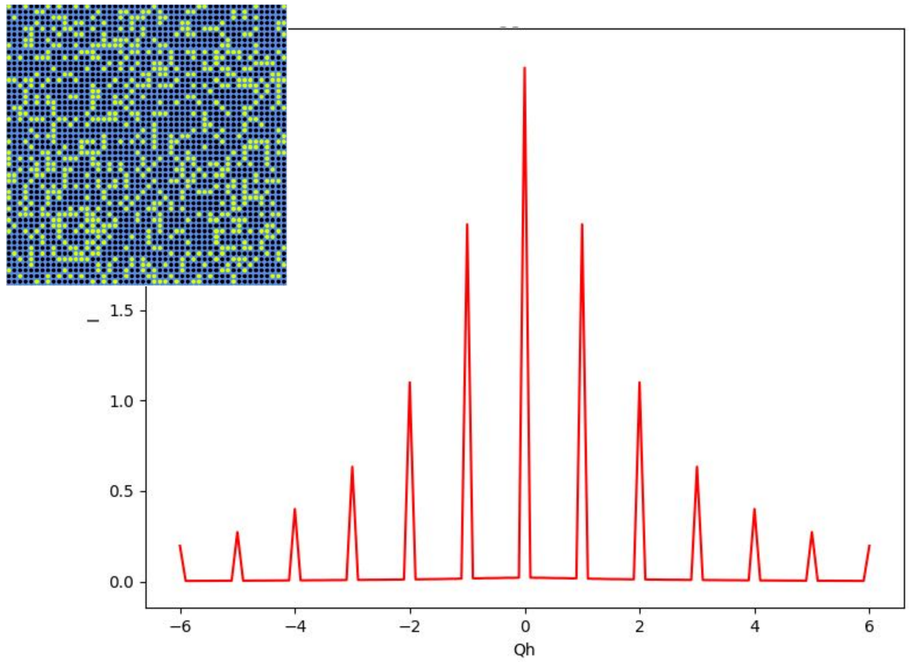


Model due to Thomas Proffen

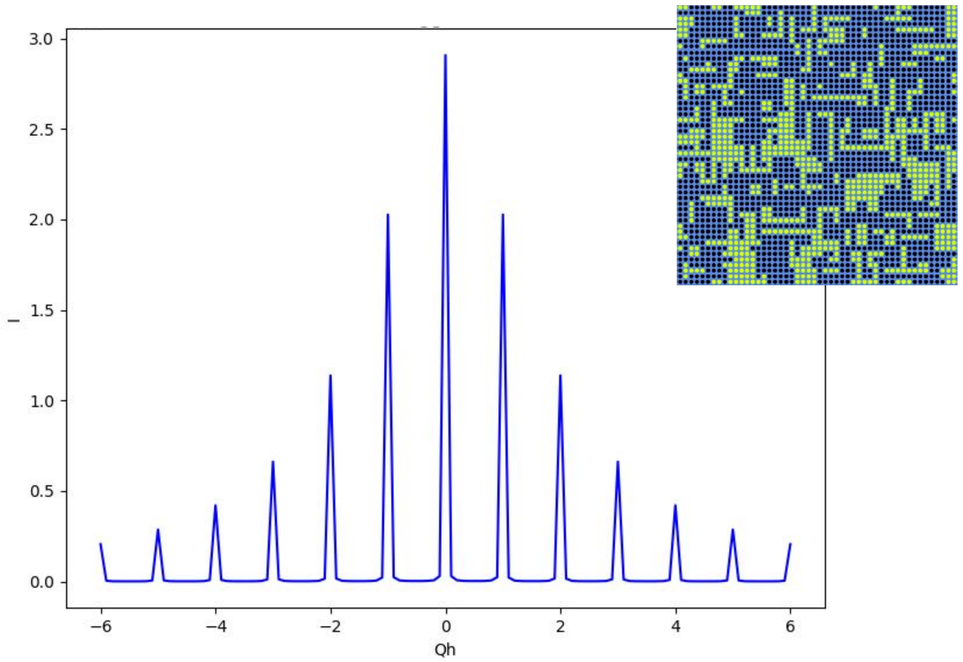
BRAGG SCATTERING

The average occupancy is unchanged ➡ Bragg peaks are identical

Random Vacancies



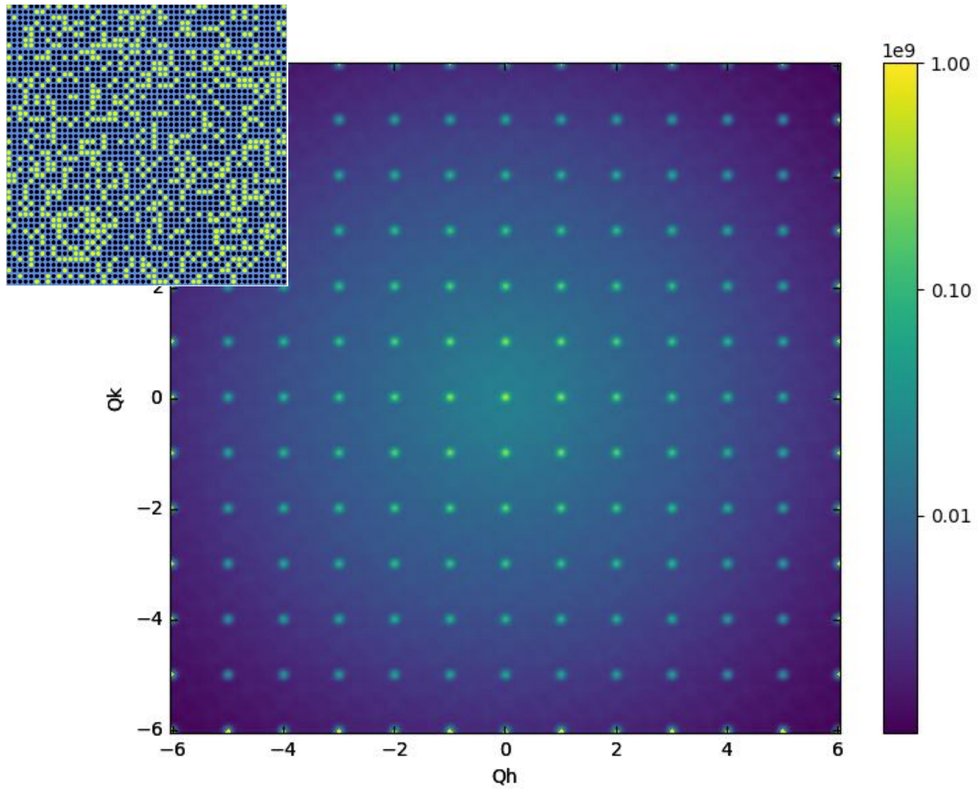
Vacancy Clusters



DIFFUSE SCATTERING

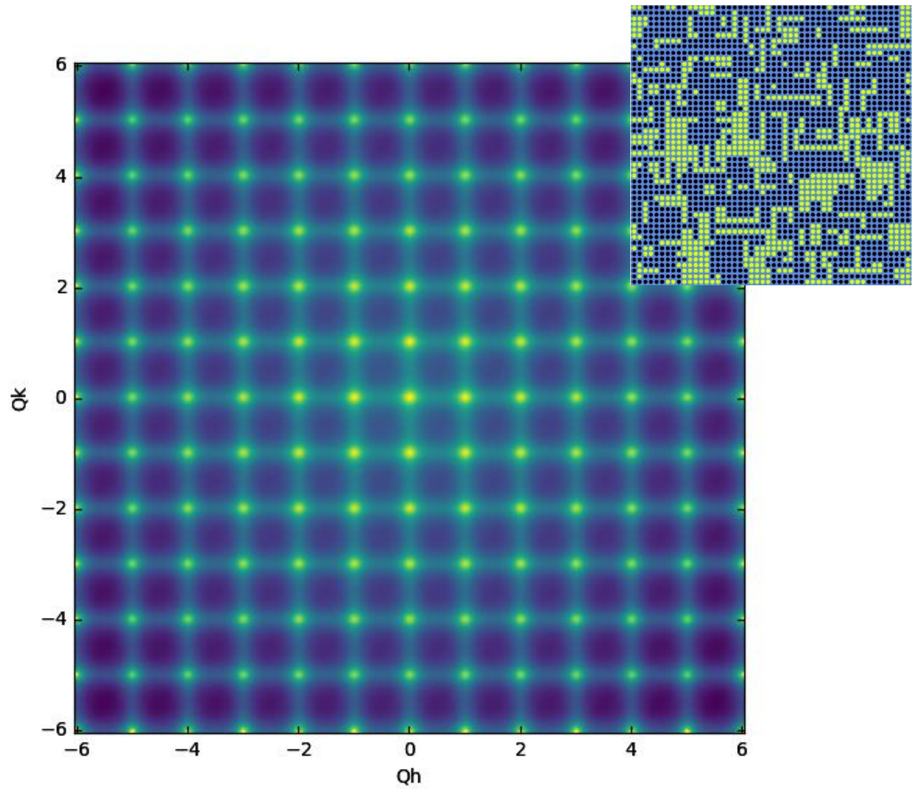
The diffuse scattering is quite different.

Random Vacancies



Laue Monotonic Scattering

Vacancy Clusters



Substitutional Diffuse Scattering

WHAT IS IT GOOD FOR?

DIFFUSE SCATTERING FROM METALLIC ALLOYS

Short-range Order in Null Matrix $^{62}Ni_{0.52}Pt_{0.52}$

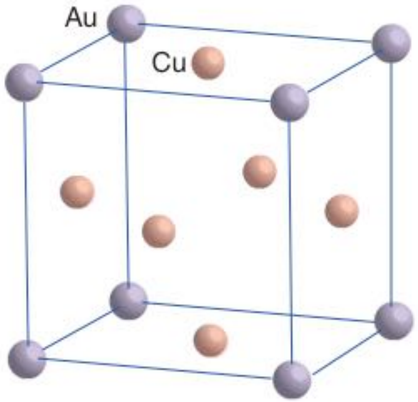
D. J. P. Morris, *et al*., Science **326**, 411 (2009).

HOW DO I MODEL IT?

DIFFUSE SCATTERING THEORY

A Few Equations $I = \sum_i \sum_j b_i b_j \exp(i\mathbf{Q} \cdot \mathbf{r}_{ij})$



J. M. Cowley, J. Appl. Phys. **21**, 24 (1950)

- **Laue Monotonic Diffuse Scattering**

$$I = \bar{b}^2 \sum_{ij} \exp(i\mathbf{Q} \cdot \mathbf{r}_{ij}) + N(\overline{b^2} - \bar{b}^2);\ \bar{b}^2 = (c_A b_A + c_B b_B)^2;\ \overline{b^2} = c_A c_B (b_B - b_A)^2$$

- **Cowley Short-Range Order**

$$I_{diffuse} = N c_A c_B (b_B - b_A)^2 + \textstyle\sum_{ij} \alpha_{ij} c_B c_A (b_B - b_A)^2 \exp(i\mathbf{Q} \cdot \mathbf{r}_{ij});\ \alpha_{ij} = \left(1 - \frac{P_{ij}}{c_j}\right)$$

- **Warren Size Effect**

$$I_{diffuse} = N c_A c_B (b_B - b_A)^2 \left(1 + \sum_{ij} \alpha_{ij} \exp(i\mathbf{Q} \cdot \mathbf{r}_{ij}) + \beta_{ij} \exp(i\mathbf{Q} \cdot \mathbf{r}_{ij})\right);\ \beta_{ij} = f(\epsilon^{ij}_{AA}, \epsilon^{ij}_{BB})$$

- **Borie and Sparks Correlations**

$$I = \sum_i \sum_j b_i b_j \exp\left(i\mathbf{Q} \cdot (\mathbf{R}_i - \mathbf{R}_j)\right) \left[1 + i\mathbf{Q} \cdot (\mathbf{u}_i - \mathbf{u}_j) - \frac{1}{2}\left(\mathbf{Q} \cdot (\mathbf{u}_i - \mathbf{u}_j)\right)^2 + \ldots\right]$$

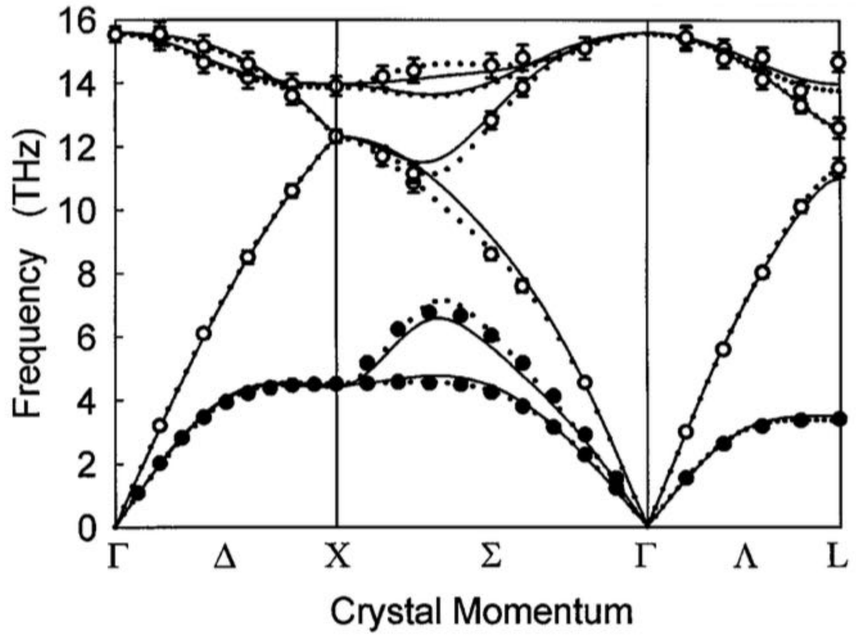
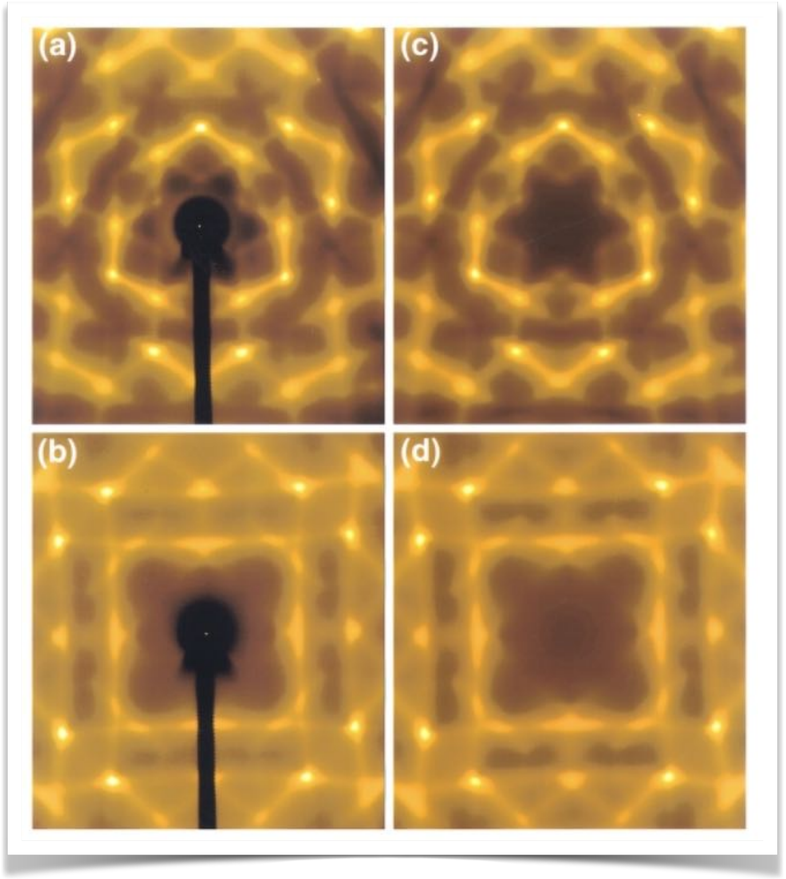
▪ Sharp Bragg reflections	→	▪ 3D-periodic structure
– no defects		– no defects
▪ Sharp diffuse rods	→	▪ 2D-periodic structure
– no defects		– perpendicular to the streaks
		– disordered in streak directions
▪ Sharp diffuse planes	→	▪ 1D-periodic structure
– no defects		– perpendicular to the planes
		– disordered within the plane
▪ Diffuse clouds	→	▪ 0D-periodic structure
– no defects		– no fully ordered direction

THERMAL DIFFUSE SCATTERING

M. Holt, *et al*, Phys Rev Lett **83**, 3317 (1999).

- Lattice vibrations produce deviations from the average structure even in perfect crystals
- X-ray scattering intensity is given by the integral over all the phonon branches at each Q





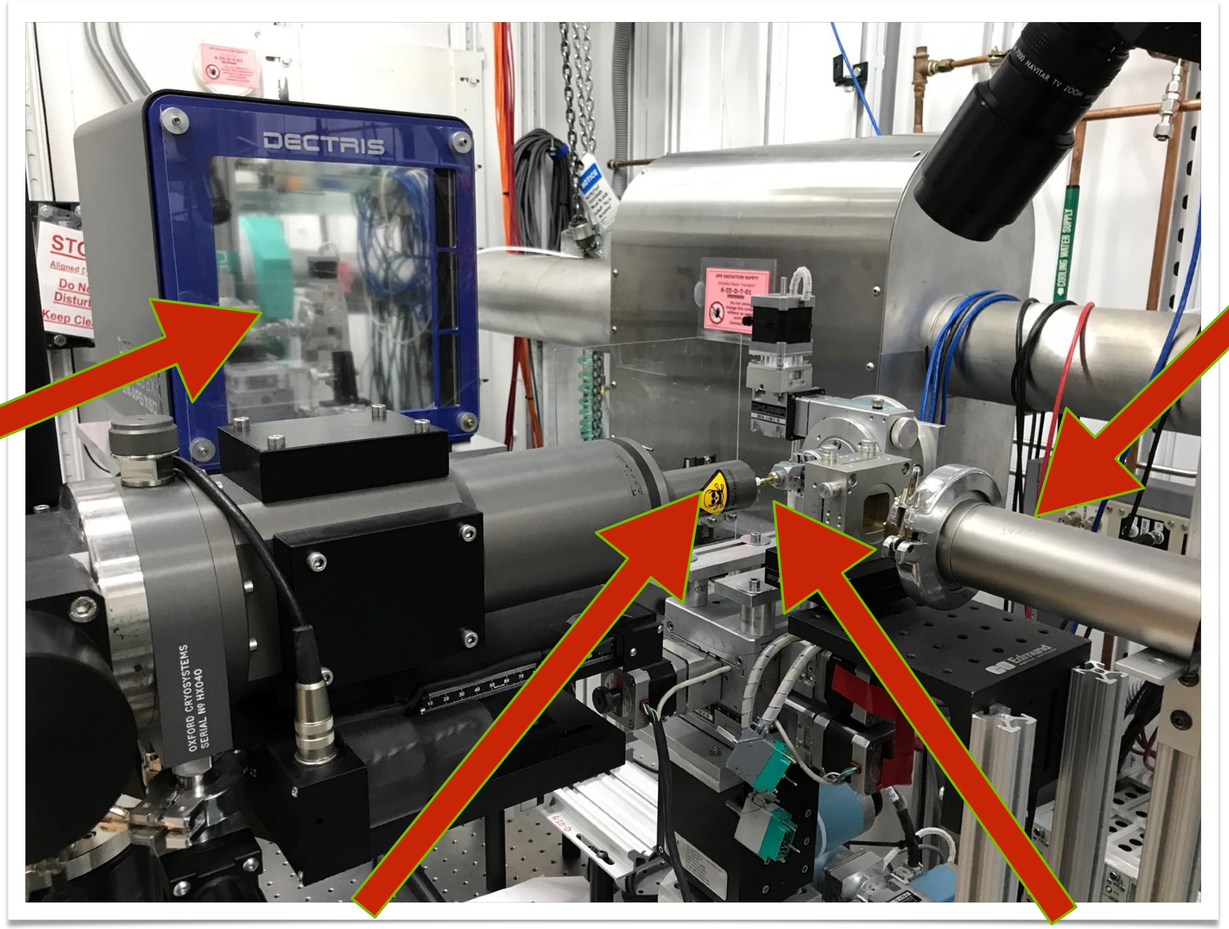
$$I_0 \propto f^2 e^{-2M} \sum_{j=1}^{6} \frac{|\mathbf{q} \cdot \hat{\mathbf{e}}_j|^2}{\omega_j} \coth\left(\frac{\hbar\omega_j}{2k_B T}\right).$$

HOW DO I MEASURE IT?

MEASURING X-RAY DIFFUSE SCATTERING

Continuous Rotation Method

Sector 6 - APS



Incident Beam

Detector

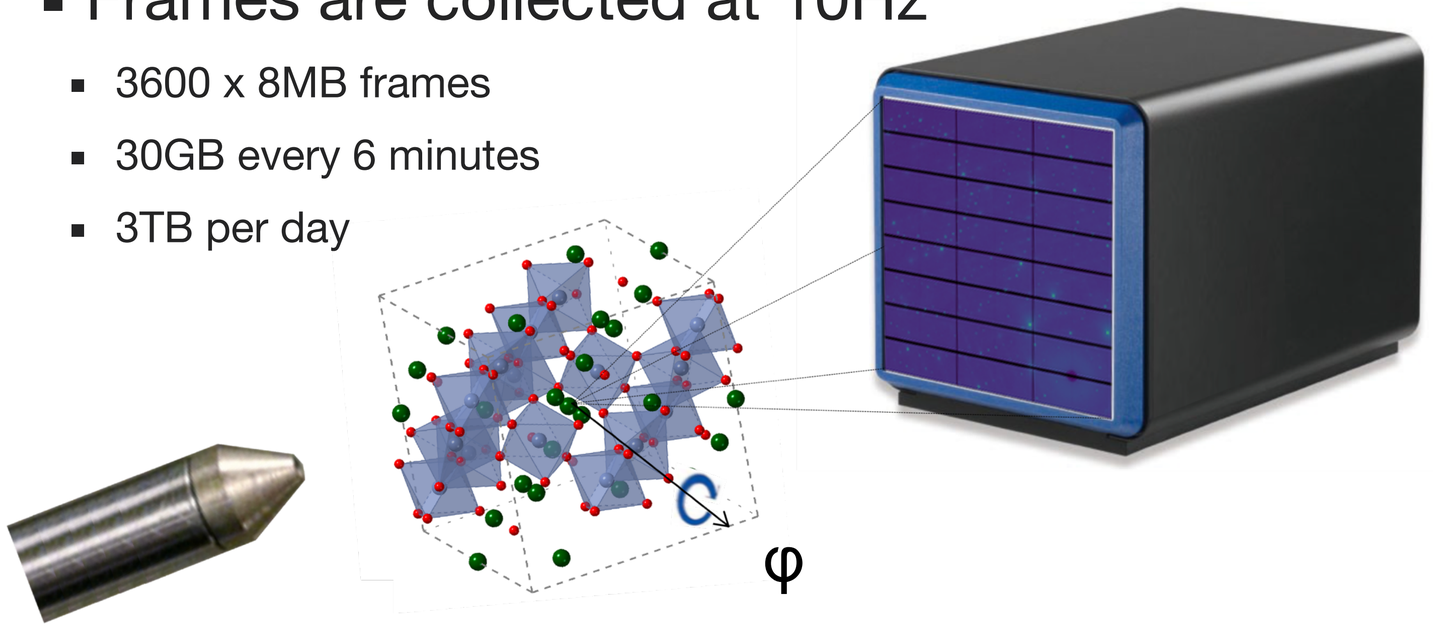
Cryocooler

Sample

X-RAY SCATTERING GEOMETRY

Continuous Rotation Method

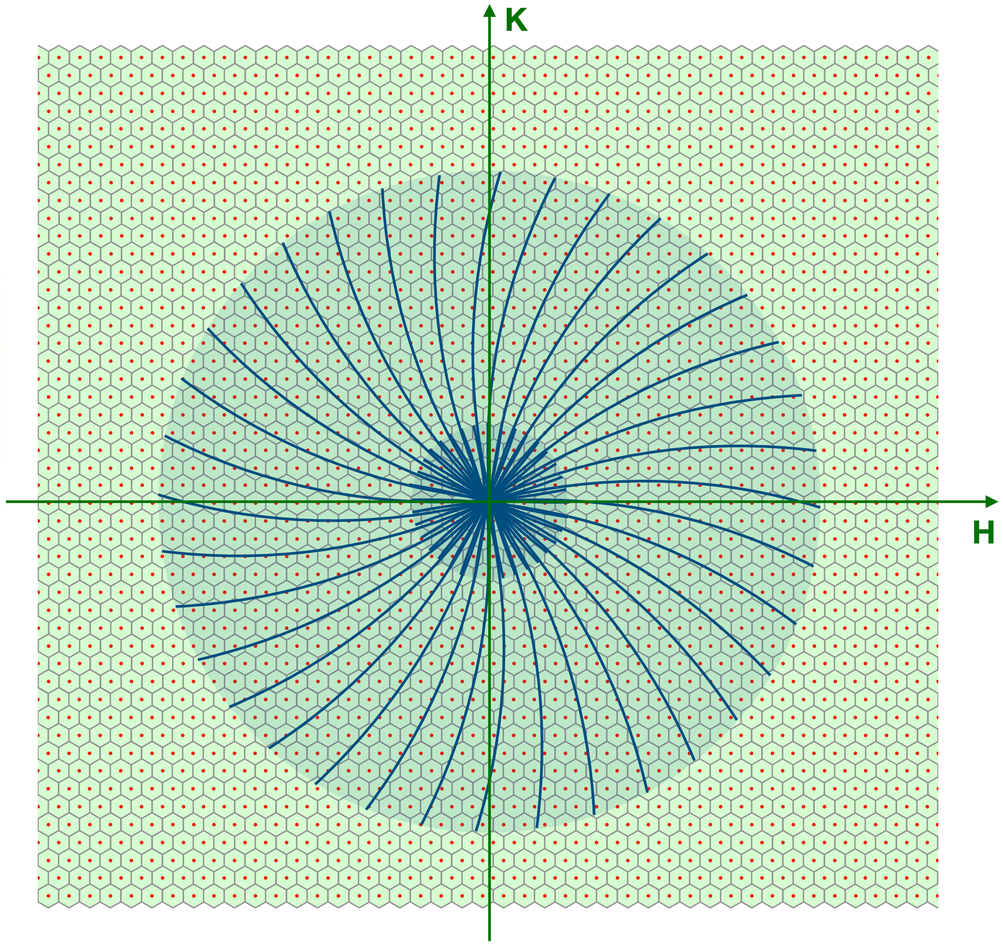
- The sample is continuously rotated at $1°s^{-1}$
- Frames are collected at 10Hz
  - 3600 x 8MB frames
  - 30GB every 6 minutes
  - 3TB per day



Incident Beam

Sample

Pilatus 2M CdTe Detector



Reciprocal Space

Q-RANGE IN ROTATION METHOD ON SECTOR 6

- With the following parameters, we cover $-15Å^{-1}<\mathbf{Q}<15Å^{-1}$
  - E_i ~ 87 keV
  - λ ~ 0.14 Å
  - Detector distance ~650 mm
  - Pilatus 2M CdTe: 1679x1475 pixels
  - Pixel size ~170 μm
- This Q-range includes thousands of Brillouin zones.
  - *e.g.*, for *a* ~ 10 Å, ~60,000 Bragg peaks

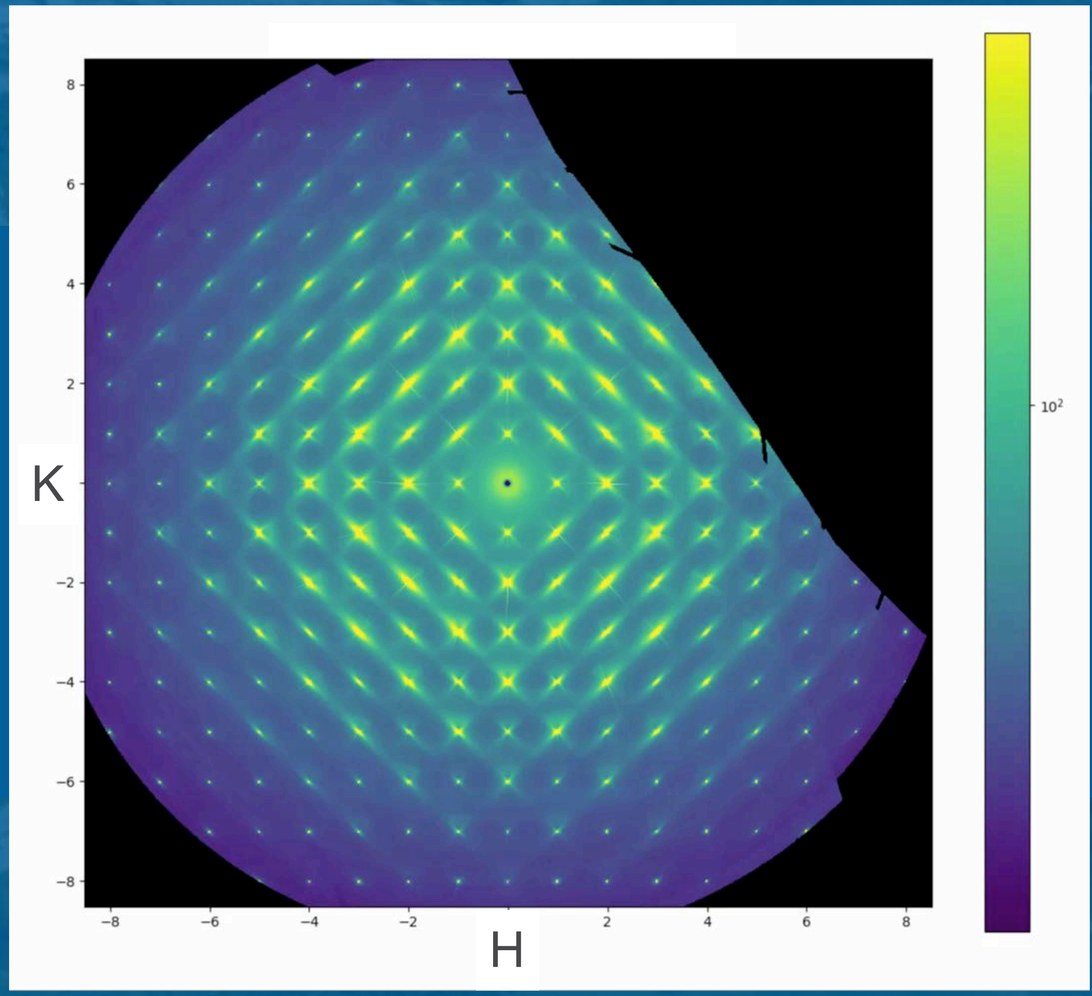
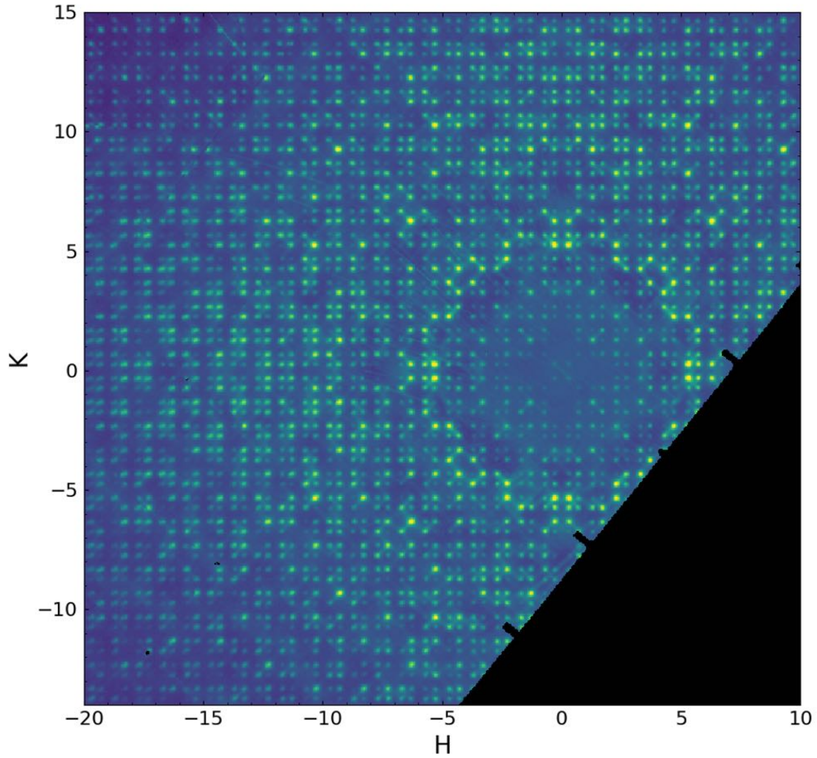
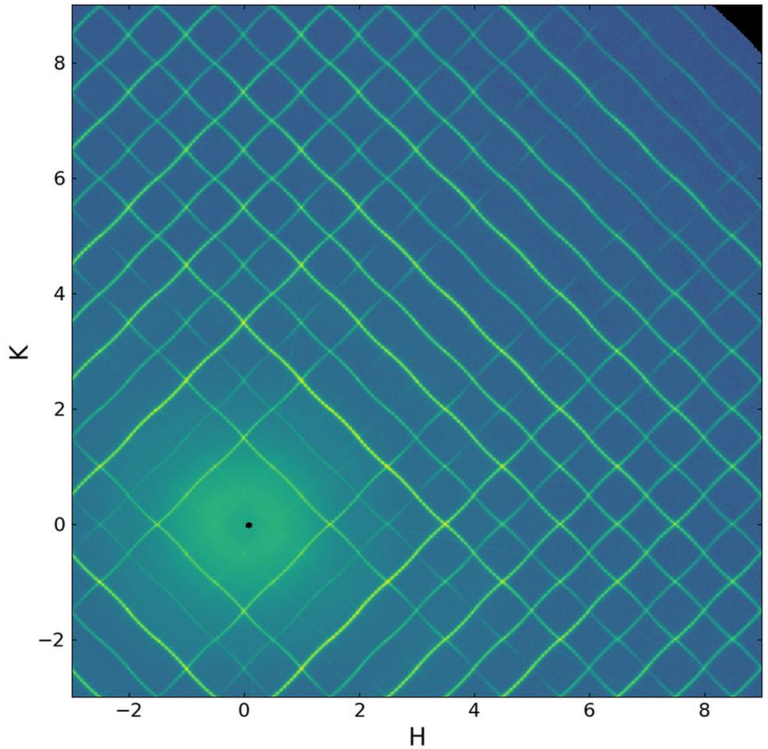
DIFFUSE SCATTERING IN 3D
THE RELAXOR $PbMg_{1/3}Nb_{2/3}O_3$

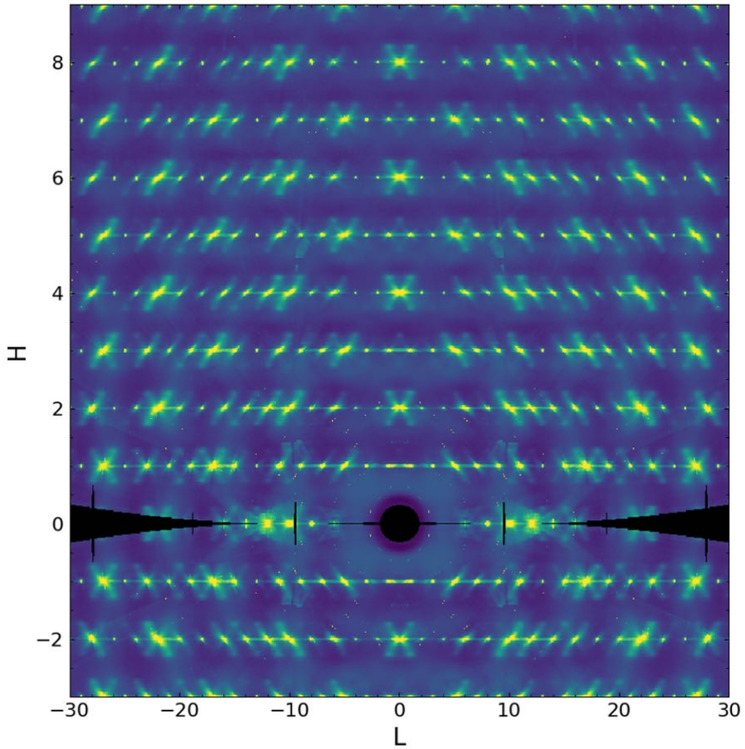
M. J. Krogstad, *et al*, Nature Materials **48**, 1 (2018).



DIFFUSE GALLERY







CASE STUDY 1: MULLITE

MULLITE - A CASE STUDY

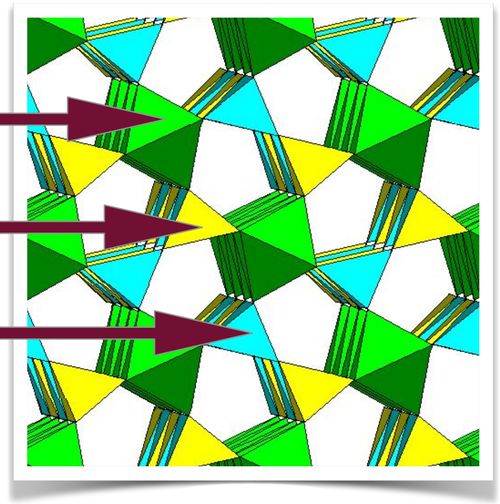
B. D. Butler, T. R. Welberry, & R. L. Withers, Phys Chem Minerals **20**, 323 (1993)

- Mullite is a ceramic that is formed by adding O^{2+} vacancies to Sillimanite
  - Sillimanite has alternating AlO_4 and SiO_4 tetrahedra
  - Mullite has excess Al^{3+} occupying Si^{2+} sites for charge balance
- This results in strong vacancy-vacancy correlations

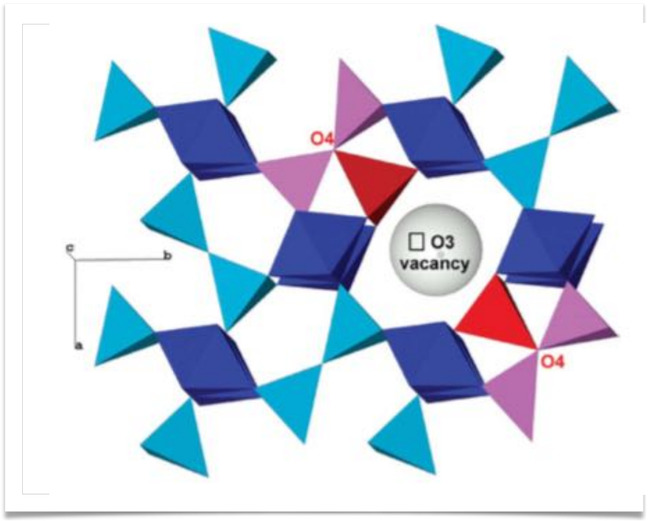
AlO_6 Octahedra

SiO_4 Tetrahedra

AlO_4 Tetrahedra



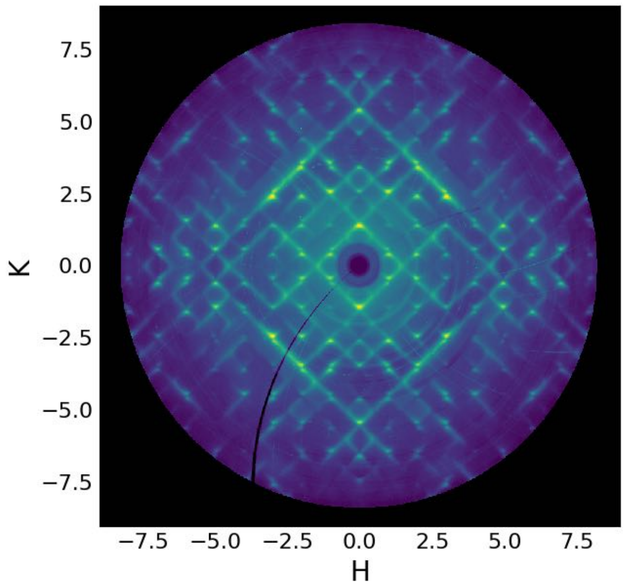
Sillimanite: Al_2SiO_5



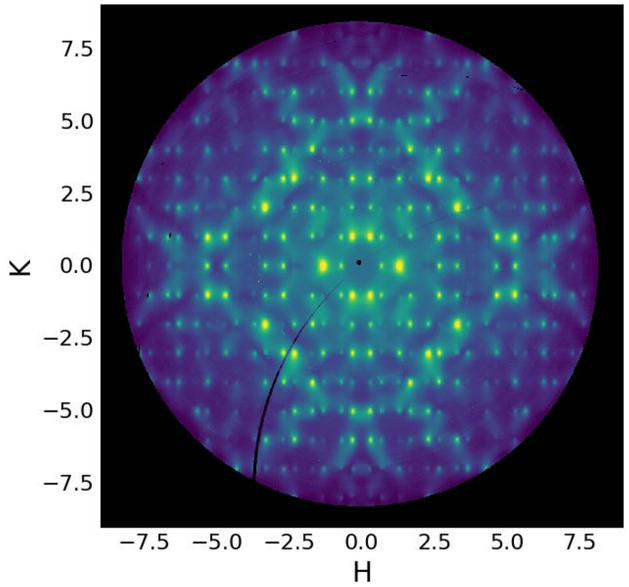
Mullite: $Al_2(Al_{2+2x}Si_{2-2x})O_{10-x}$

3D DIFFUSE SCATTERING IN MULLITE

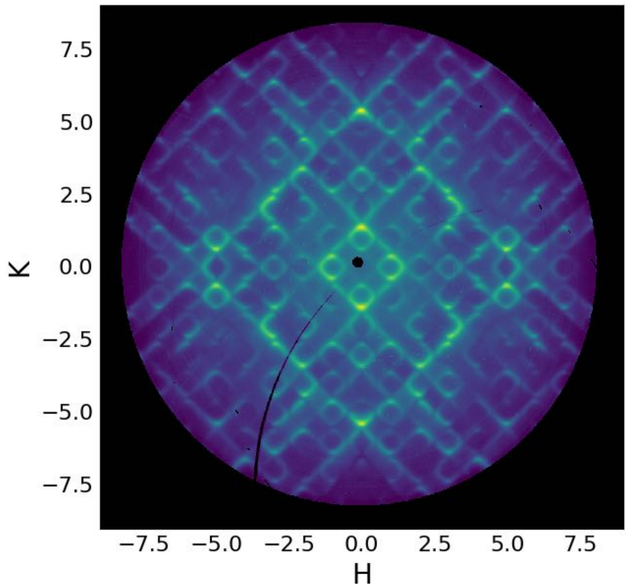
- There is strong diffuse scattering throughout reciprocal space
- The shape of the diffuse scattering is strongly dependent on the value of L



L=0.16



L=0.5

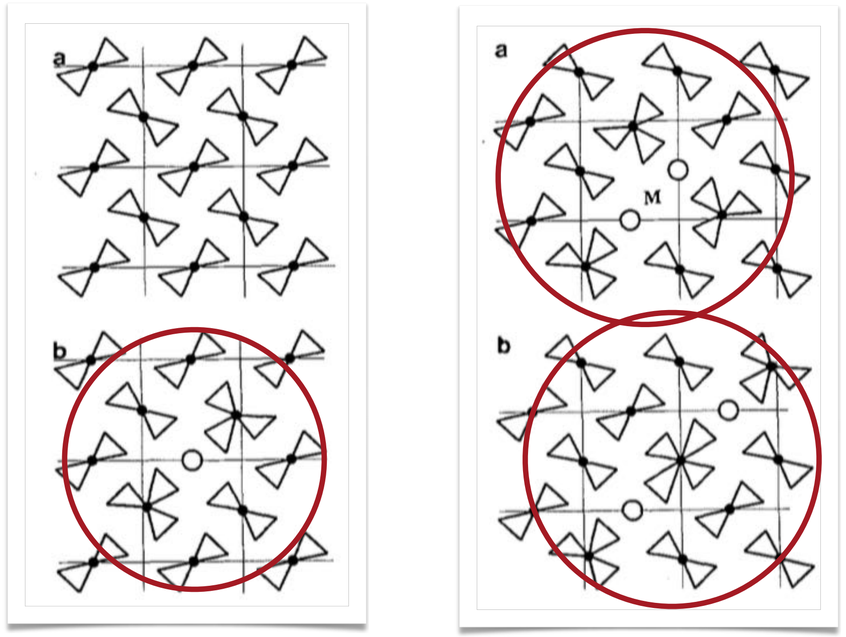


L=0.75

MONTE CARLO ANALYSIS

B. D. Butler, T. R. Welberry, & R. L. Withers,
Phys Chem Minerals **20**, 323 (1993)

- In a classic analysis, Richard Welberry and colleagues developed a set of interaction energies to model mullite disorder
- Interaction energies were initialized:
  - insights from chemical intuition
  - insights from the measured diffuse scattering
- The diffuse scattering was calculated using a Monte Carlo algorithm to generate vacancy distributions first in 2D slices and then in 3D



Interatomic vector	α_{lmn}	Interatomic vector	α_{lmn}

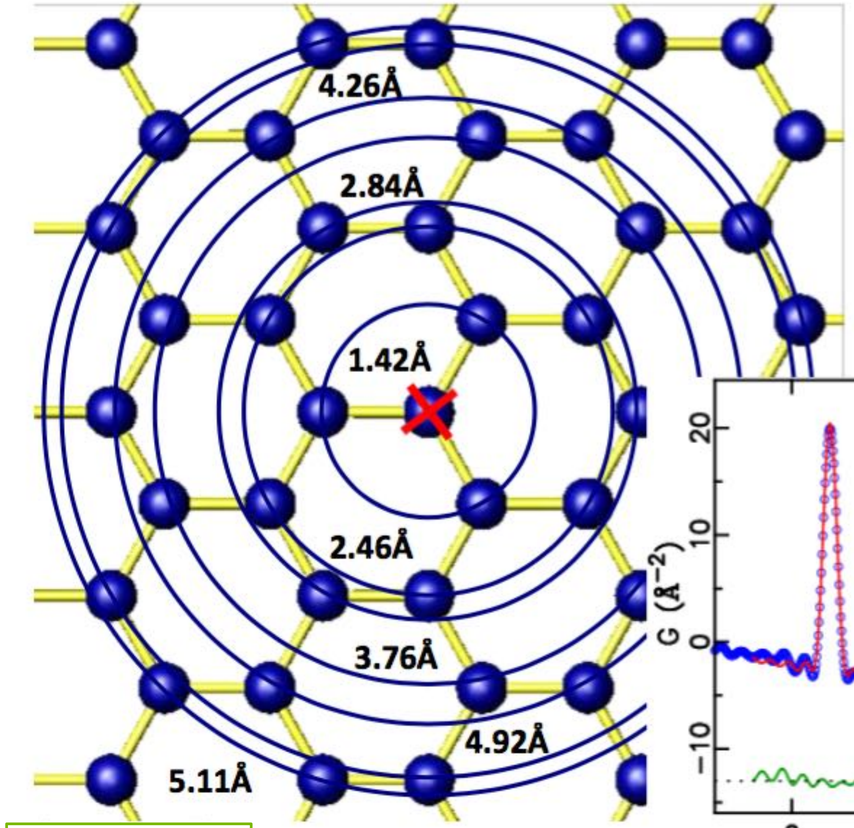
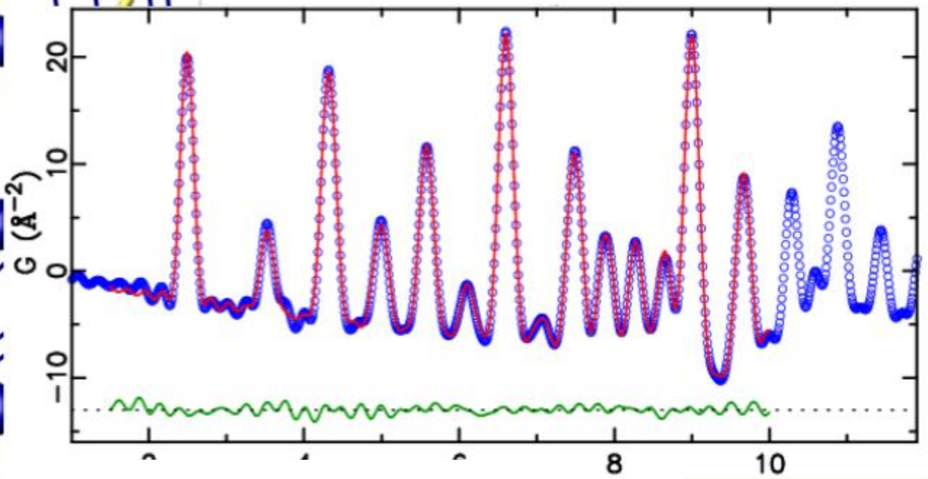
PAIR DISTRIBUTION FUNCTION ANALYSIS



Radial atomic **p**air **d**istribution **f**unction (PDF) gives the interatomic distance distribution, or "probability" of finding atomic pairs distance *r* apart



$$G(r) = 4\pi r[\rho(r) - \rho_o] = (2/\pi) \int_{Q=Q_{min}}^{Q_{max}} Q[S(Q) - 1]\sin(Qr)dQ$$

Emil Bozin (ADD 2013)

THREE-DIMENSIONAL PAIR DISTRIBUTION FUNCTIONS

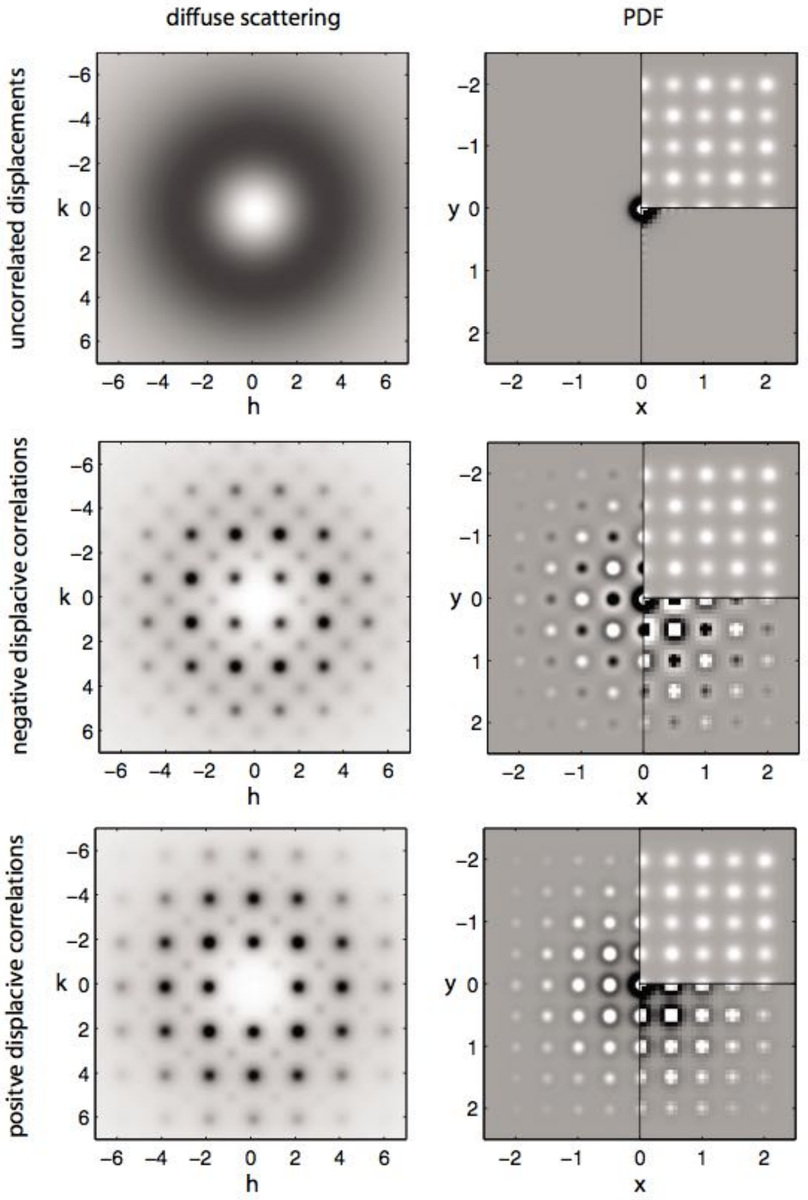
238 Z. Kristallogr. **2012**, *227*, 238–247 / **DOI** 10.1524/zkri.2012.1504

The three-dimensional pair distribution function analysis of disordered single crystals: basic concepts

Thomas Weber* and Arkadiy Simonov

Laboratory of Crystallography, ETH Zurich Wolfgang-Pauli-Str. 10, 8093 Zurich, Switzerland

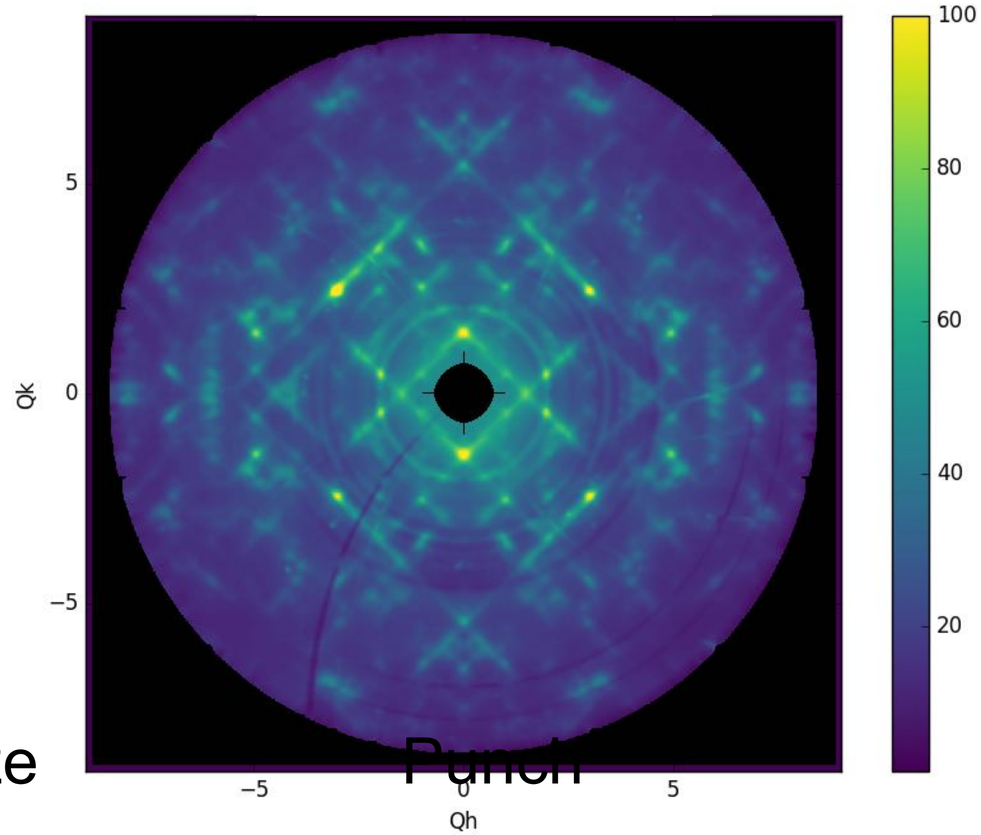
- The 3D PDF technique was pioneered by Thomas Weber and colleagues at ETH
  - Philippe Schaub, Walter Steurer, Arkadiy Simonov
  - See *Yell* - A. Simonov, *et al*, J Appl Cryst **47**, 1146 (2014).
- The ability to measure three-dimensional S(**Q**) over a large volume of reciprocal space provides the 3D analog of PDF measurements.
  - Total PDFs if Bragg peaks and diffuse scattering can be measured simultaneously
  - ΔPDFs if the Bragg peaks are eliminated
- This allows a model-independent view of the measurements in real space.



“PUNCH AND FILL”

$$I = \sum_i \sum_j b_i b_j \exp(i\mathbf{Q} \cdot \mathbf{r}_{ij})$$

$$P_{tot}(\mathbf{r}) = FT\left[I(\mathbf{Q})\right] = FT\left[|\bar{F}(\mathbf{Q})|^2\right] + FT\left[|\Delta F(\mathbf{Q})|^2\right] = P_{hkl}(\mathbf{r}) + \Delta P(\mathbf{r})$$



Symmetrize

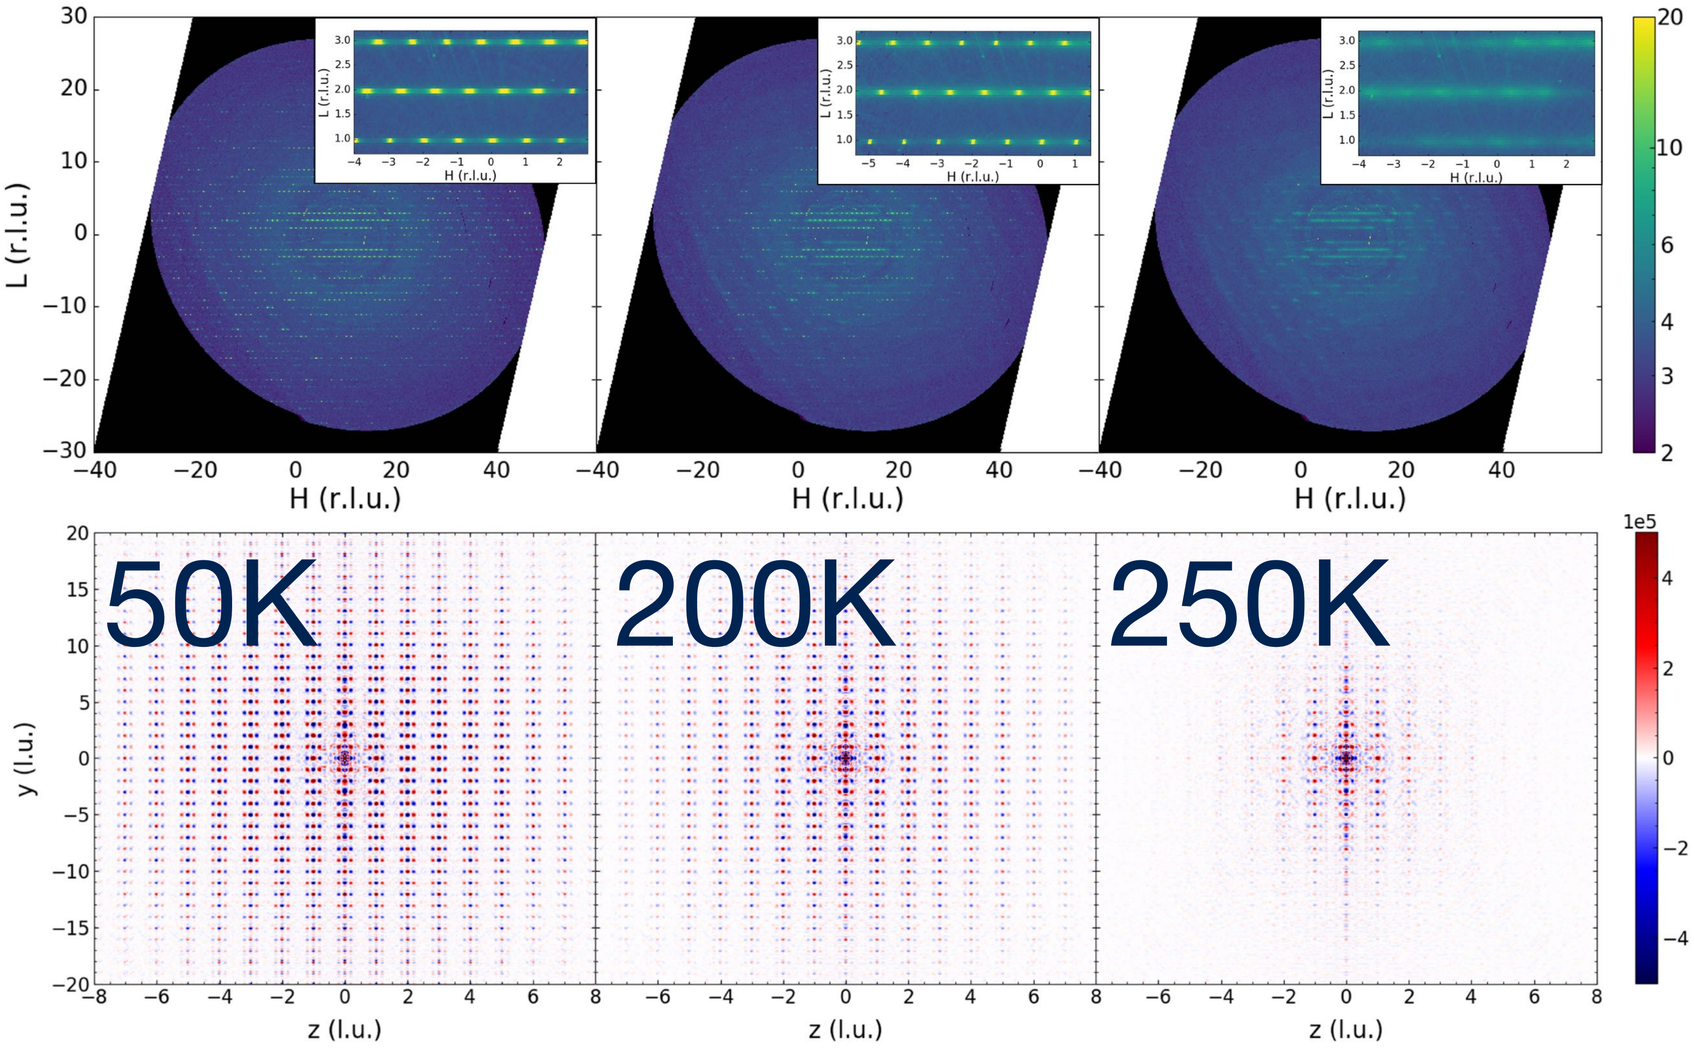
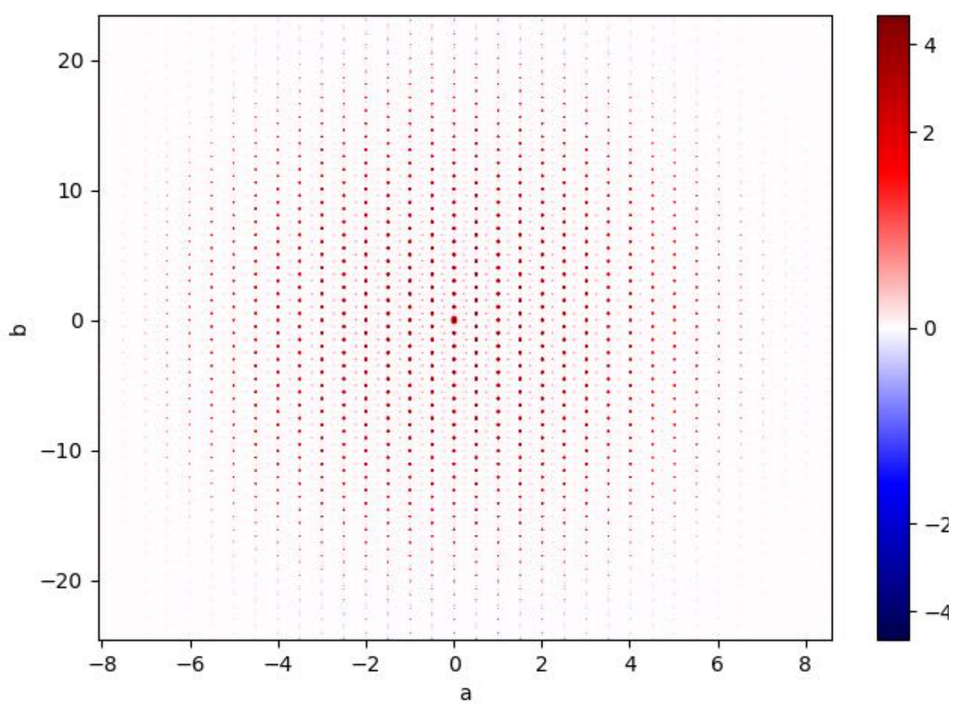
ORDER-DISORDER TRANSITION VIEWED IN REAL SPACE

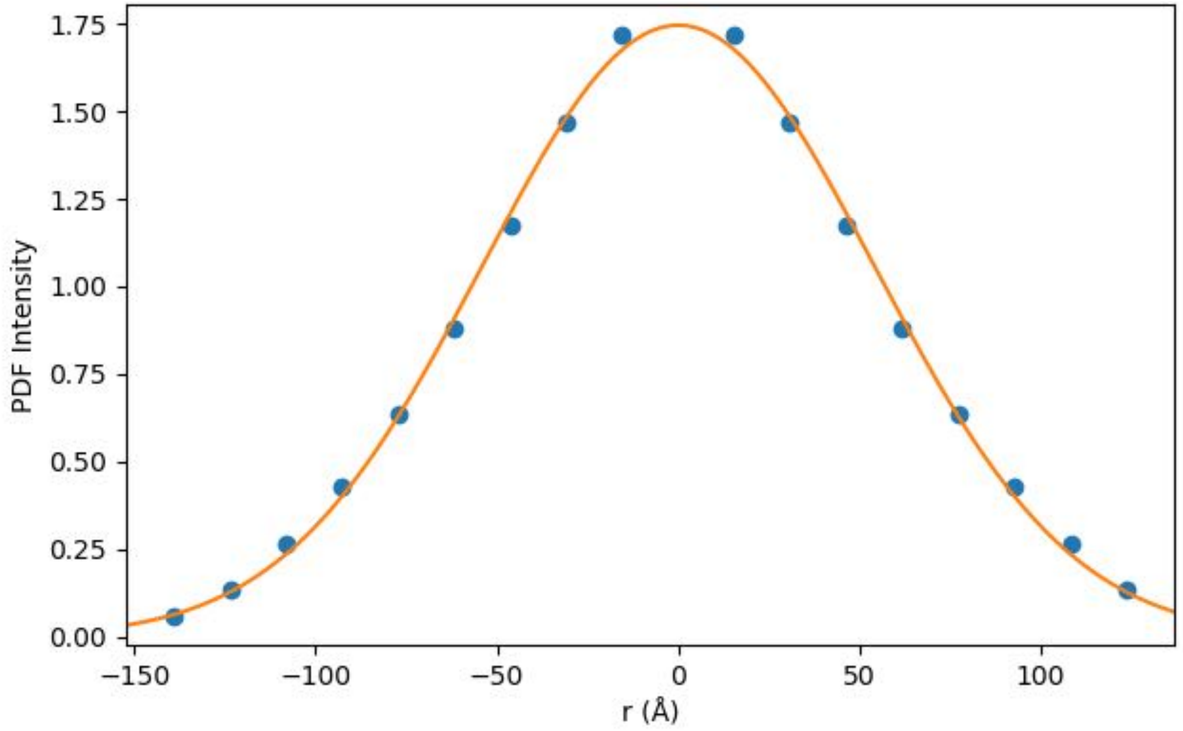
$Na_{0.45}V_2O_5$



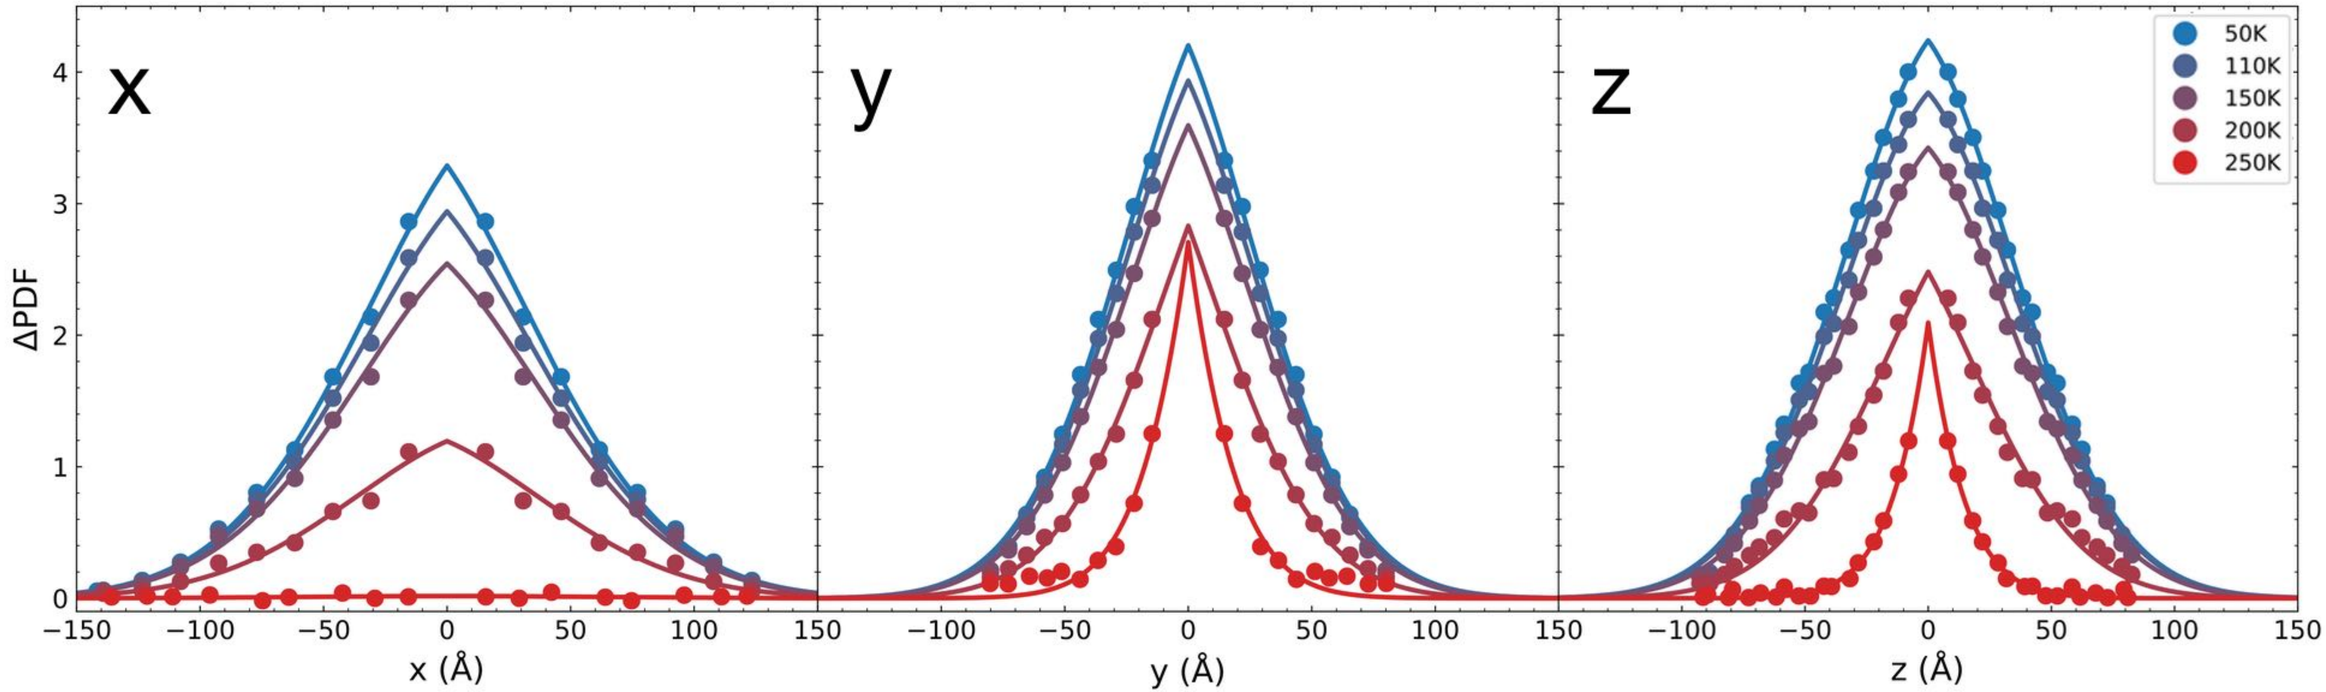
EFFECT OF Q-RESOLUTION

- Finite Q-resolution ➡ Gaussian envelope in real space.
- The width can be determined from the total PDF
  - *i.e.*, the transform of the long-range crystal structure.

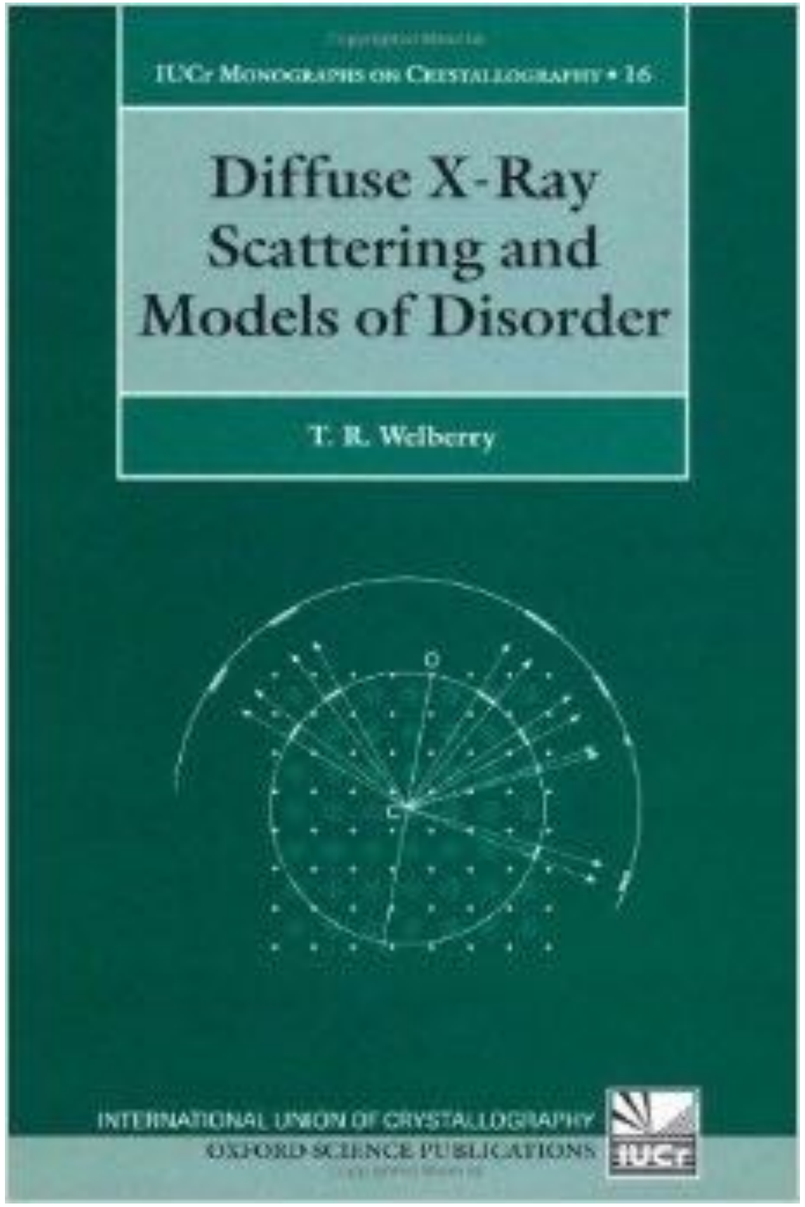




FITTING CORRELATION LENGTHS IN REAL SPACE



$$f(\mathbf{r}) = A \times G(\mathbf{r}) \times \exp(-|\mathbf{r}|/\xi)$$



24.3.3 *Ordering of Na within the two-leg ladders.*

Fig. 24.10(a) shows a small region near the origin of the x = 0 plane of the ΔPDF map obtained from the 50K X-ray data. The strong white origin peak indicates perfect positive correlation for an atom with itself. Other white peaks also indicate a positive correlation between an atom at the origin with another at a position given by the vectors A, B or C (and the reverse vectors -A, -B and -C). Conversely the dark peaks indicate strong negative correlations. It is quite straightforward to deduce from the observed pattern of white and dark peaks that the local arrangement of the Na ions must follow a pattern like that shown in Fig. 24.10(b), where the occupancy of the two Na sites on each rung of the two-leg ladders tends to alternate between (Na□[†]) and (□Na) producing a zig-zag chain of occupied sites. Neighbouring ladders at $z = \pm 1.0$ have the same occupancy pattern which is in phase with the ladder at $z = 0$.

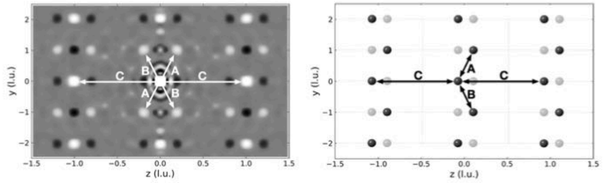


Fig. 24.10 A comparison of (a) the ΔPDF peak intensities at 50K in the $x = 0$ plane of $Na_{0.45}V_2O_5$ with (b) the derived real-space model of sodium ions. Data used in this figure are reproduced with kind permission of Dr Ray Osborn.

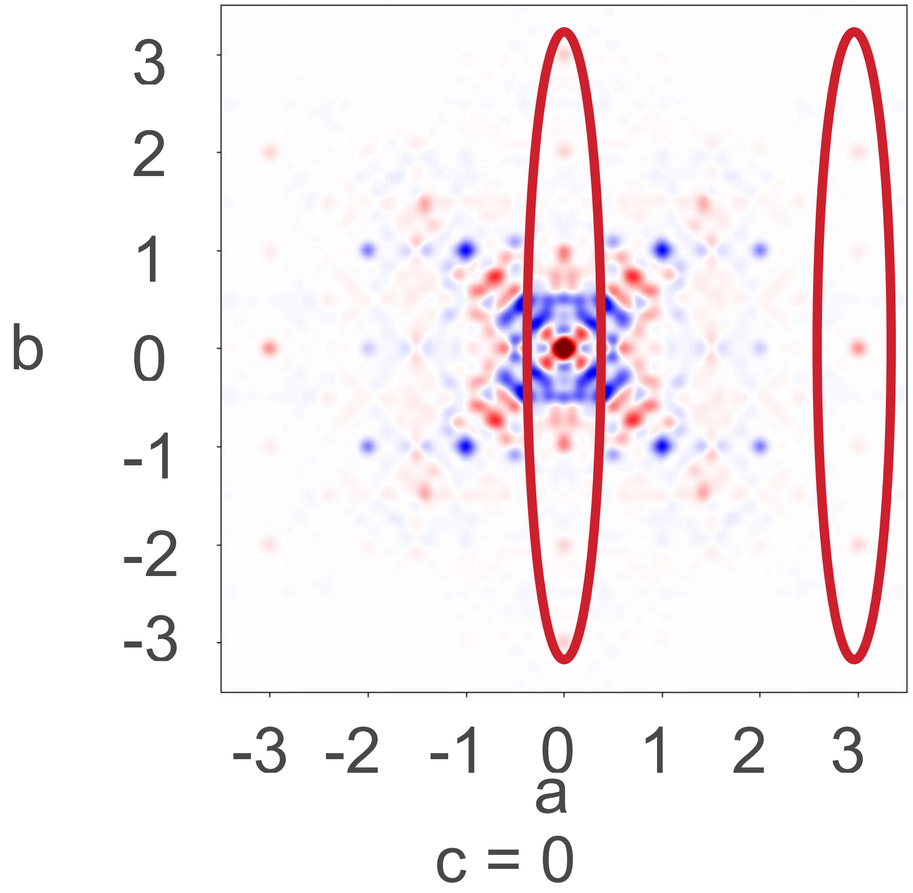
24.3.4 *ΔPDF peak intensities in the $z = 0$ plane.*

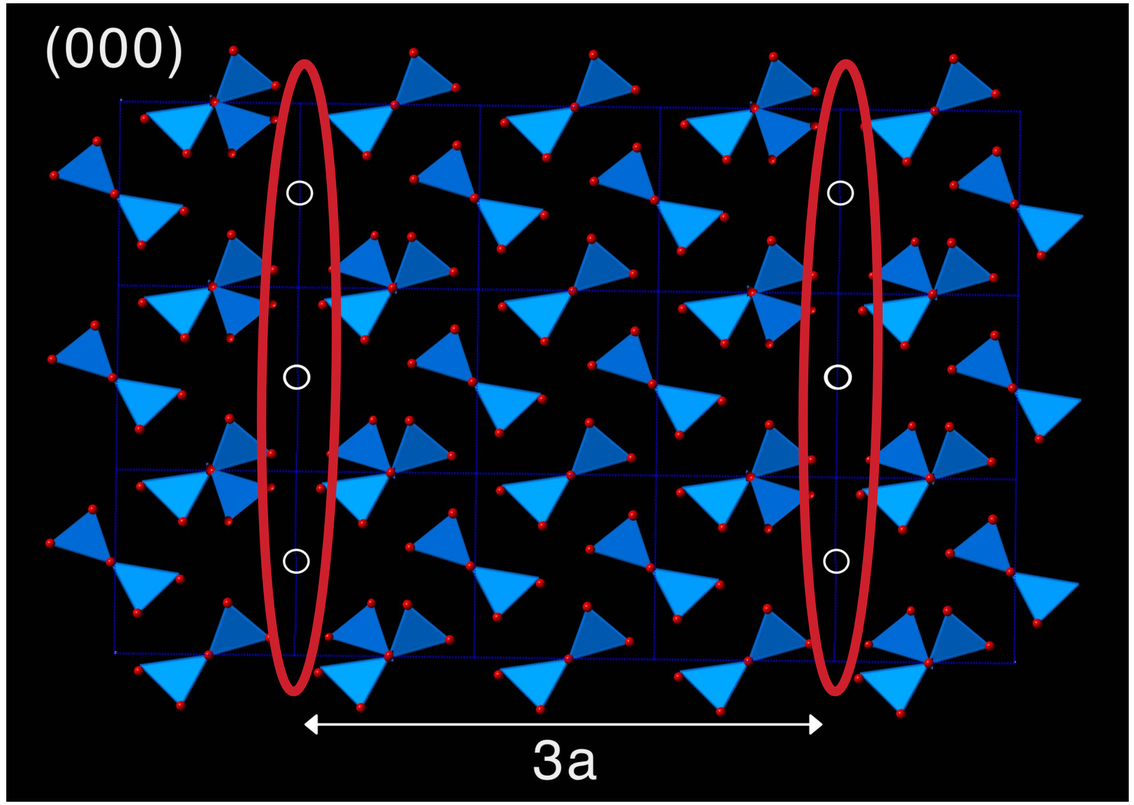
Fig. 24.12 shows the $z = 0$ plane of the ΔPDF map observed at three different temperatures. Fig. 24.11(b) shows an enlargement of part of Fig. 24.11(a) where white arrows (labelled A –F) have been used to identify different interatomic vectors. The same set of vectors is shown in Fig. 24.11(e) which is a plot of the $z = 0$ plane of the average structure. The maps are dominated by the same alternating correlations of Na occupancy along the ladder direction parallel to y. Similarly neighbouring chains at $x = \pm 1$ are instep with that at $x = 0$ for temperatures 50K and 150K but at 250K these correlations have been lost.

Although the maps are dominated by the correlations in the Na ladders there are numerous weaker peaks that correspond to correlations between the ladder Na_1 ions and the interstitial Na_2 ions. These correspond to vectors A, B, C and E in Fig. 24.11(e) and involve one Na_1 and one Na_2 ion. These peaks are clearly evident in the 50K map, somewhat less evident at 150K and even less evident at 250K. They are weak relative to those involving Na_1 ions alone simply because of the low occupancy of the Na_2 sites.

[†]here □ is used to represent a vacant site

BACK TO MULLITE





HOW DO I LOOK AT STATIC DISORDER?

COMPARISON OF ELASTIC SCATTERING AND THE STATIC APPROXIMATION

$$G(\mathbf{r},t) = \frac{1}{N}\left\langle \sum_{i=1}^{N}\sum_{j=1}^{N} \delta(\mathbf{r} - \mathbf{r}_i(t) + \mathbf{r}_j(0))\right\rangle$$

$$S(\mathbf{Q},\omega) = \frac{1}{N}\frac{1}{2\pi\hbar}\int_{\infty}^{\infty} e^{-i\omega t}dt \int G(\mathbf{r},t)e^{-i\mathbf{Q}\cdot\mathbf{r}}d\mathbf{r} \qquad \hbar\delta(t) = \frac{1}{2\pi}\int_{-\infty}^{\infty} e^{i\omega t}d(\hbar\omega)$$

$$\left(\frac{d\sigma}{d\Omega}\right)_{coh}^{static} = b_{coh}^2 N \int G(\vec{r},0)e^{i\vec{Q}.\vec{r}}d\vec{r}$$

$$\left(\frac{d\sigma}{d\Omega}\right)_{coh}^{elastic} = b_{coh}^2 N \int G(\vec{r},\infty)e^{i\vec{Q}.\vec{r}}d\vec{r}$$

CHESS 55keV X-rays

THE FUTURE

- Advances in instrumentation have transformed our ability to measure single crystal total scattering over large volumes of reciprocal space.
  - High-Energy X-rays
  - Time-of-Flight Neutrons
- This is enabling new ways of analyzing the data:
  1. Unsupervised machine learning
  2. *ab initio* computational modeling
  3. 3D-ΔPDF - real-space pair distributions
- The results give unique insight into disordered materials
  - Bridging the gap between diffraction and imaging
